

STATEMENT OF INTEREST

Pregnancy loss remains a neglected yet high-burden reality in our setting, and we have witnessed its consequences firsthand. In our clinical experience in Cameroon, women often present late with complications, receive fragmented care, and are frequently lost to follow-up. These gaps reflect not only resource limitations, but the absence of structured decision support and efficient referral pathways in low-resource health systems.

Our team of six brings together complementary expertise: a medical doctor with frontline experience in maternal and emergency care, a project manager, a data analyst, two web developers, and a mobile app developer. This combination allows us to bridge clinical insight with technical execution. While our technical members bring skills in data analysis and digital product development, our clinical perspective ensures that the solution remains grounded in real-world needs and workflows.

We are particularly interested in leveraging AI as a practical tool to support frontline providers; enhancing triage, guiding timely referrals, and strengthening follow-up care after pregnancy loss. Our approach prioritizes feasibility, ensuring that any solution we develop is accessible, adaptable, and functional within the constraints of Sub-Saharan African health systems.

What makes our team a strong addition is our shared commitment to building inclusive and ethical solutions that respond to real gaps in care. We are motivated by impact and by the opportunity to co-create innovations that can improve outcomes for women in our communities and across the region.
